

* Conditionals-:

if statements in Go do not use parentheses around the condition:

```
if height > 4 {  
    fmt.Println("You are tall enough")  
}
```

* The initial statement of an if block-:

An if conditional can have an "initial" statement. The variable(s) created in the initial statement are only defined within the scope of if, else if, and else blocks.

```
if InitialStatement; condition {  
}
```

* Switch-:

Switch statements are a way to compare a value against multiple options. They are similar to if-else statements but are more concise and readable when the number of options is more than 2.

```
func getCreator(os string) {  
    var creator string  
    switch os {  
        case "linux":  
            creator = "Linus Torvalds"  
        case "windows":  
            creator = "Bill Gates"  
        case "macos":  
            fallthrough  
        default:  
            creator = "Unknown"  
    }  
    return creator  
}
```

• Notice that in Go, the break statement is not required at the end of a case to stop it from falling through to the next case. The break statement is implicit in Go.

• If you do want a case to fall through to the next case, you can use the fallthrough keyword.
